In Procedure A 4, page 3 of our Bio-protocol paper <https://bio-protocol.org/e2531>, the dilute concentration “100 μ g/ μ l” is incorrect, should be “10 μ g/ μ l”. Consequently, the volume added into DCs is “40 μ l”, the final volume should be “1.04 ml”. Figure 1 has the same mistake. The correct text should be:

4. On Day 6, the cells are pulsed with OVA (400 μ g/ml) for 24 h. In detail, OVA is diluted by PBS at **10 μ g/ μ l** first and then added into DCs at **40 μ l** per well. The final volume is **1.04 ml** per well. At least 2 wells of cells are untreated with OVA as negative control for the reaction.

The revised Figure 1 is:

Figure 1. OVA pulsed DCs preparation. Bone marrow cells are isolated from B6 mice and cultured in completed medium with GM-CSF and IL-4 for 7 days. Half/half medium is changed on Day 2. BM-DCs are stimulated with IFN- γ on Day 5 for 48 h and are pulsed with OVA on Day 6 for 24 h. Cells are harvested on Day 7 and washed thoroughly before using.
